

PURE™ Safety AUDITS MODULE

Scheduling, Recording and Managing Responses to Your Site Audits

Regular site audits are necessary for compliance against a range of environmental and safety management standards. They also ensure that corporate level commitments are being enacted at the site level and reduce the risk created through bad practice and non-compliance. The Audits module can be used for managing safety site audits for your facilities or your supplier facilities.

KEY BENEFITS & FEATURES

- **Entering Audit Data** – Details are logged in the system using intuitive online forms. The forms are configured to collect the data you require and can incorporate multiple questionnaire sets for different types of audit.
- **Managing Non-Compliance** – If an audit identifies non-compliances, corrective actions can be raised and assigned to specific individuals with resolution dates.
- **Resolving Issues** – Users responsible for corrective actions will receive automated emails and in-system dashboard updates to drive issue resolution and 'close out'. Similar updates can be sent to pre-assigned site managers so they remain informed of activity in their location.
