How do you manage and demonstrate building governance and safety throughout your building portfolio?

Safety management relies on information that is accurate, verifiable and easily accessible. Building systems and features must be fit for purpose, maintained and safe. Having all the information cataloged and accessible is invaluable for applying predictive analytics and proactively mitigating risks.

What safety features do your buildings have? How do you track and manage workflows and routines? How do you identify and manage risks across your property portfolio? How can you use data to drive decisions?

Built InForm™ is a software platform that enables building owners and operators to track and manage safety and governance activities throughout their property portfolios.

All of your building profiles and digital records are accessible at your fingertips. View building features and activities, identify gaps and address risks as they arise. Be empowered with quick access to records and information to disclose to external parties as needed.

- Catalog all building features and records
- Manage governance and compliance programs
- Track safety and service activities to specific individuals
- Control information and access with role-based permissions
- Spot trends and be more proactive in addressing risk
