

Services for healthy buildings

Reactive indoor environmental quality inspections

Expert guidance in managing indoor environment concerns

Keeping your occupants safe, healthy and productive is the goal of any facility or property manager. A proactive indoor environmental quality (IEQ) program allows you to monitor the health of your building on an ongoing basis and evaluate the need for changes or improvements to building systems before a problem occurs — but you should be equally prepared to react to the unexpected IEQ incident or complaint.

Our reactive IEQ inspections provide peace of mind through science-based, expert guidance on addressing IEQ incidents and occupant air quality complaints. The inspections include an investigation into the nature and history of the incident or complaint in addition to on-site testing. We provide corrective action recommendations and review corrective actions already taken by the building.

UL Solutions offers a comprehensive range of reactive inspection services for building owners and managers to quickly identify and resolve indoor environmental disruptions, including:

- Mold and moisture inspections
- Mold clearance inspections
- Flood clearance inspections
- Focused air quality inspections
- Odor inspections
- Water quality testing
 - Legionella
 - Lead in water

Keep your building's occupants healthy and productive with help from UL Solutions, the global safety science experts.
